

WordPress Basics, File Hierarchy, HTML, CSS, Bootstrap & PHP

Multi-Session Beginner-Friendly Teaching Material

SESSION 1 – HTML BASICS

HTML structures a webpage. It defines elements like headings, paragraphs, images, and lists.

Basic HTML Structure:

```
<!DOCTYPE html>
<html>
<head><title>My Website</title></head>
<body>
<h1>Welcome</h1><p>This is my first website.</p>
</body>
</html>
```

Common Tags: h1–h6, p, img, a, ul/li, div, span, form.

SESSION 2 – CSS BASICS

CSS styles the webpage—colors, fonts, spacing, layout, and more.

Basic CSS Example:

```
body { background: #f5f5f5; font-family: Arial; }
h1 { color: #2A6CB3; text-align: center; }
```

Key Concepts: margin, padding, borders, display, flexbox, hover effects.

SESSION 3 – BOOTSTRAP BASICS

Bootstrap helps build responsive layouts quickly using a 12-column grid system.

Bootstrap Grid Example:

```
<div class='row'>
```

```
<div class='col-6'>Left</div>
<div class='col-6'>Right</div>
</div>
```

Useful Classes: container, row, col-md-6, btn btn-primary, text-center, d-flex.

SESSION 4 – WORDPRESS FILE HIERARCHY

WordPress chooses templates based on a hierarchy system.

Important Theme Files:

- style.css – main stylesheet
- functions.php – theme logic and scripts
- header.php – top area
- footer.php – bottom area
- index.php – fallback template
- single.php – single post
- page.php – standalone page
- archive.php – category archives
- sidebar.php – widgets

WordPress loads the most specific file available.

SESSION 5 – WORDPRESS PHP BASICS

PHP powers WordPress and loads dynamic content.

Basic PHP:

```
<?php echo 'Hello World'; ?>
```

Useful WP Functions:

- get_header()
- get_footer()
- the_title()
- the_content()
- get_template_part()

WordPress Loop:

```
<?php if (have_posts()) : while (have_posts()) : the_post(); ?>
```

```
<h2><?php the_title(); ?></h2>
<?php the_content(); ?>
<?php endwhile; endif; ?>
```

RECAP

Students should now understand:

- HTML = structure
- CSS = design
- Bootstrap = responsive layout
- WordPress File Hierarchy = how pages load
- PHP Basics = how WordPress outputs content

EXERCISES

1. Create an HTML page with heading, paragraph, image, button.
2. Style it using CSS (background, typography).
3. Rebuild using Bootstrap grid.
4. Inside WordPress, identify header.php, footer.php, index.php.
5. Open single.php and locate the_title() and the_content().

HOMEWORK

Build a mini webpage (HTML + CSS + Bootstrap). Then compare its structure with a WordPress theme.
