

Academic Hour 1 (45 minutes)

Understanding the WordPress Content Workflow

When working on a real website, content is rarely written and published immediately.

Most professional websites use a **content workflow**.

This allows teams to **write, review, schedule, and publish content correctly**.

WordPress Post Statuses

WordPress provides several **content statuses**.

Draft

The post is **not visible to the public**.

Used when:

- Writing a new article
- Saving unfinished work
- Preparing content

Example:

A blog post that is still being written.

Pending Review

Used when content needs **approval from an editor or administrator**.

Example:

A writer submits an article but an editor must review it before publishing.

Scheduled

Allows content to be **published automatically at a specific time**.

Example:

A marketing team schedules a blog post to be published **tomorrow at 9 AM**.

Benefits:

- Automatic publishing
 - Consistent content schedule
 - Time management
-

Published

The post becomes **visible on the website**.

Visitors can now read the content.

WordPress Content Workflow Example

Typical workflow:

Writer

↓

Creates Draft

↓

Editor Reviews Content

↓

Post becomes Pending Review

↓

Editor Approves

↓

Post is Scheduled or Published

Practical Exercise (10–15 minutes)

Students should:

1. Create a **new blog post**
2. Add a title
3. Write a short paragraph
4. Save it as **Draft**
5. Change status to **Pending Review**
6. Schedule the post for **tomorrow**
7. Publish it manually

Goal:

Students understand **how content moves inside WordPress**.

Academic Hour 2 (45 minutes)

Media Optimization & Accessibility

Images and media are extremely important for websites.

But **unoptimized media can make a website slow**.

A slow website leads to:

- Poor SEO
 - Bad user experience
 - Higher bounce rate
-

Image Optimization Best Practices

1 Use compressed images

Recommended size:

- Under **300 KB**

Large images slow down websites.

2 Use descriptive filenames

Bad example:

IMG_12345.jpg

Good example:

wordpress-training-course.jpg

Search engines understand images better.

3 Add ALT TEXT

ALT text describes images.

Example:

Image: laptop with WordPress dashboard

ALT text:

WordPress dashboard interface

Benefits:

- Helps **SEO**
 - Helps **visually impaired users**
-

4 Avoid very large image dimensions

Example:

Bad:

5000px image

Good:

1200px image

What is Web Accessibility?

Accessibility means **making websites usable for everyone**.

Including:

- People with visual disabilities
 - People using screen readers
 - Users with slow internet
 - Mobile users
-

Basic Accessibility Rules

Use proper headings

Correct structure:

H1 – Main title

H2 – Section titles

H3 – Subsections

Example:

H1 Website Title

H2 Blog Section

H3 Subtopic

Use good color contrast

Bad example:

Light gray text on white background.

Good example:

Dark text on white background.

Do not put important text inside images

Screen readers cannot read images.

Important information should always be **real text**.

Use readable fonts

Recommended:

- Clear fonts
 - Proper spacing
 - Good font size
-

Class Task (15 minutes)

Students must create a **blog post that includes:**

- A title
- A subtitle
- At least **one optimized image**
- ALT text added to the image
- Proper headings (H2 or H3)
- A short paragraph describing a topic

Example topics:

- WordPress Basics
 - My First Website
 - Web Design Tips
-

Teacher Discussion

Ask students:

- Why are optimized images important?
- What happens if images are too large?
- Why is accessibility important?
- How does ALT text help SEO?
